

Q-Function Approximation,

[Learning to Play Freeway, using Reinforcement Learning](#)

$$Q(s, a) \approx f$$

Features and representation:

— Feature function returning a feature vector:

$$f(s, a) = \begin{pmatrix} f_1(s, a) \\ \vdots \\ f_n(s, a) \end{pmatrix} = \begin{pmatrix} 1/12 \\ 1/12 \\ \vdots \\ 0 \end{pmatrix}$$

— Weight vector: $n \times |A|$

Approximating $Q(s, a)$

$$Q(s, a) = \underbrace{f_1(s, a)} \cdot \underbrace{w_1^a} + \underbrace{f_2(s, a)} \cdot \underbrace{w_2^a} \dots + \underbrace{f_n(s, a)} \cdot \underbrace{w_n^a}$$

Q-learning Update:

execute a

→ for each feature i :

$$w_i^a \leftarrow \underbrace{w_i^a}_{\text{same}} + \alpha \left[\underbrace{r + \gamma \max_{a'} Q(s', a') - Q(s, a)}_{Q(s', a') \text{ for } s, s, a} \right] f_i(s, a)$$

Example (Freeway):

Assume $Q(s, a) = 0$ for all s, a

Update:

$$w_i \leftarrow w_i + \alpha [r + \gamma \max_{a'} Q(s', a') - Q(s, a)] f_i(s, a) \quad \frac{1}{D} = \frac{1}{1}$$

$$\leftarrow 0 + \left[10 + 0.9 \times 0 \right] \left(\frac{1}{1} \right)$$

$$w_i \leftarrow 5$$

Deep Q learning:

$$\theta_i \leftarrow \theta_i + \alpha [r + \gamma \max_{a'} Q(s', a') - Q(s, a)] \frac{\partial Q(s, a)}{\partial \theta_i} \quad \text{gradient}$$
