

- ① $2+2$ (+) 2_2 [Chapter 1] ⑩: m + Data.Ratio. 加法操作
 $2 * (-3)$ $2 * -3$ X : m = module
 \Rightarrow unset + t 取消
 \Rightarrow type 'a'
- ② && 与 || 或
 不等于 != 不是 !=
 not True 不确定加括号 ✗
- ③ 列表 [1, 2, 3], 所有元素同 type ✗
- ④ $[1..10] = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]$ ① type { strong : 强制转换, 用途广泛
 enumeration: 列举 static: 在编译期知道 value and type
 automatically inferred.
- ⑤ $[3, 1, 3] ++ [3, 7] = [3, 1, 3, 3, 7]$ True && "False" \Rightarrow 报错.
 ++ 连接两个列表
 2点 \Rightarrow 错误较少, 不可能运行时发生类型错误更安全.
- ⑥: 增加一个元素到列表头部
 $1 : [2, 3] = [1, 2, 3]$ ② 常用类型: Char: 单个 unicode 字符.
 $\Delta \Rightarrow$ 必须新元素, 第二个必须列表.
 Bool: True False
- ⑦ \n 换行 it 列表答
 必须用 putStrLn., 才能换行.
 直接输入, 就直接显示 \n it.
- ⑧ let a = ['l', 'o', 't', 's'].
 a == "lots"
 " " == []
- 'a': "bc" == "abc"
- 单字符 "", 字符串 ""
- "foo" ++ "bar" == "foobar"
- ⑨ 类型名: 大写字母开头,
 变量: 小写字母开头.
- (it):: [Char].
- 最后一次求值的结果, ghci 辅助功能
- ⑩ compare ≥ 3) == LT
 \Rightarrow True
 compare (sqrt 3) (sqrt 6)
 \Rightarrow LT 不加符号报错.
- ⑪ String = [Char]. 别名.
- ⑫ head [1, 2, 3] \Rightarrow 1 it:: Num a \Rightarrow it
 tail [1, 2, 3] \Rightarrow [2, 3]
 tail [1, 2] \Rightarrow [2]

⑥ 引用传递类型 \Rightarrow 多态 (polymorphic)

$[a] \Rightarrow$ 类型为 a 的列表.

$[[\text{Int}]] \Rightarrow [\text{Int}]$ 类型的列表.

⑦ 元组 * (1964, "Labyrinths")

长度固定, 包含不同类型的值.

用括号包围.

$(\text{True}, "hello") :: (\text{Bool}, [\text{Char}])$

$() \Rightarrow$ 零个元素的元组.

命名: 2-元组.

⑧ 只有当元组(数量、位置一致)相同.

\Rightarrow 元组的类型相同.

$(\text{False}, 'a') :: (\text{Bool}, \text{Char})$

$(\text{True}, 'b') :: (\text{Bool}, \text{Char})$

⑨ 应用场景:

① 若一个函数返回多个值, 可以将其放到一个元组, 然后返回元组作为函数的值.

② 当需要定长容器, 但又没必要用自己定义型, 可以用元组.

⑩ 处理列表和元组的函数.

take: 收集 n , 列表 l .
 $\underline{\underline{\text{take}}} : \text{返回一个包含前 } n \text{ 个元素的列表}$

$\text{take } 2 [1, 2, 3, 4, 5]$

$\Rightarrow [1, 2]$

drop: 返回去掉了前 n 个元素的列表.

$\text{drop } 2 [1, 2, 3, 4, 5]$

$\Rightarrow [3, 4, 5]$

⑪ $\text{fst}, \text{snd} \Rightarrow$ 取出一个元组的第 i 个元素.

返回元组第一个如果是 i 个元素.

$\text{fst } (1, 'a') \Rightarrow 1$

$\text{snd } (1, 'a') \Rightarrow 'a'$

⑫ $\text{lines} :: \text{String} \rightarrow [\text{String}]$

lines 函数接受单个字符串, 按 $\backslash n$:
将字符串分割成多个字符串.

$\text{lines } "the quick\nbrown fox\njumps"$
 $\Rightarrow ["the quick", "brown fox", "jumps"]$

⑬ 不纯函数都以 IO 开头.

:t readFile

$\Rightarrow \text{readFile} :: \text{FilePath} \rightarrow \text{IO String}$

⑭ 变量, 一旦变量绑定其值
形式, 那么变量的值不会改变
不允许修改值.

⑮ $\text{myDrop } n xs = \text{if } n < 0 \text{ || null } xs$

△

then xs

else $\text{myDrop } (n-1)$
 $(\text{tail } xs)$

不同改类型相同.

⑯ 惰性求值: 直到被需要才值

Chapter 3

① data 定义新数据类型
 (data) BookInfo = Book Int String [String]
 deriving (Show)

BookInfo: 类型构造器 > 名字相同
 Book: 值构造器

:t Book I "abc" ["abc", "def"]
 => Book I "abc" ["abc", "def"] :: BookInfo.

② type: 没置别名

type BookReward = (BookInfo, BookReview)

data Bool = False I True

③ 元组和代数类型. b: ([Char], [Char]).

a = ("abc", "def") a = b.
 b = ("def", "abc") a ≠ b.

:t a => a :: ([Char], [Char])

data Ceta = Ceta String String

data Fur = Fur String String

c = Ceta "Por" "Gray"

d = Fur "Por" "Gray"

:t c => c :: Ceta

:t d => d :: Fur c ≠ d.

④ 教学

data Roagin = Red
 | Orange
 | Yellow
 | Green
 deriving(Eq, Show)

⑤ 例题五面

(3)

sumList (x:xs) = x + sumList xs
 sumList [] = 0.

⑥ 遍配等 -

要包括所有情况, 包括空构造器

⑦ data Maybe a = Just a
 | Nothing

⑧ data Tree a = Node

= Node a (Tree a) (Tree a)
 | Empty
 deriving (Show)

⑨ mySecond :: xs = if null (tail xs)
 then error "list too short"
 else head (tail xs)

⇒ 如果要指出某操作会失败

→ 用 Nothing 表示, 反之用 Just

SafeSecond [] = Nothing

SafeSecond xs = if null (tail xs)

then Nothing

else Just (head (tail xs))

SafeSecond [1] => Nothing

SafeSecond [1, 2] => Just 2

⑩ 引入局部变量(1) let · 例 ② square :: [Double] → [Double]
 in 标识这个区间的结束.

```

    foo = let a=1
        in let b=2
            in a+b.
    
```

(2) where :

```

Lend 2 amount balance =
if amount < reserve * 0.5
then Just newBalance
else Nothing
where reserve = 100
      newBalance = balance - amount.
    
```

③ Upper Case

import Data.Char (toUpper)

uppercase :: String → String

uppercase(x:xs) = toUpper x : uppercase xs
 uppercase [] = [] .

base case

recursion case: 处理头部, 处理其它

④ map ⭐

输入: 一个函数, 一个列表.

将函数运用到列表的每个元素,
 得出新列表.

square2 xs = map squareOne xs

where squareOne x = x * x.

uppercase2 xs = map toUpper xs.

: t map ⭐⭐

⇒ map :: (a → b) → [a] → [b]

a, b 类型可能不一样

myMap :: (a → b) → [a] → [b].

myMap f (x:xs) = f x : myMap f xs

myMap _ [] = [] .

as Int "33"

⇒ 33

Chapter 4.

Int Parse

import Data.Char (digitToInt)

asInt xs = loop 0 xs.

loop :: Int → String → Int

loop acc [] = acc : 终止情形.

loop acc (x:xs) = let acc' = acc * 10 + digitToInt x
 in loop acc' xs.

⑤ 捕获列表元素，保留某些条件的
例：返回列表所有奇数元素：guard

oddList :: [Int] → [Int]

oddList (x:xs) | odd x = x : oddList xs

| otherwise = oddList xs

oddList [] = []

foldSum xs = foldl step 0 xs
where step acc x = acc + x
step 是累加所用函数

⇒ niceSum :: [Integer] → Integer

niceSum xs = foldl (+) 0 xs

niceSum [1, 2, 3]

= foldl (+) 0 (1:2:3:[])

⇒ foldl (+) (0+) (2:3:[])

⇒ foldl (+) ((0+1)+2) (3:[])

⇒ foldl (+) (((0+1)+2)+3) []

⇒ ((0+1)+2)+3

foldr

:: (a → b → b) → b → [a] → b

foldr step zero (x:xs) = ~~step x foldr~~

= step x (foldr step zero xs)

foldr - zero [] = zero.

niceSumFoldr :: [Int] → Int

niceSumFoldr xs = foldr (+) 0 xs

niceSumFoldr [1, 2, 3]

= foldr (+) 0 (1:2:3:[])

= 1 + foldr (+) 0 (2:3:[])

= 1 + (2 + foldr (+) 0 (3:[]))

= 1 + (2 + (3 + foldr (+) 0 ([])))

= 1 + (2 + (3 + 0))

foldl :: (a → b → a) → a → [b] → a

foldl step zero (x:xs) = foldl step (step zero x) xs

foldl - zero [] = zero

foldl 接受一个 step 函数，一个 累加器初始值，一个 list，step function 每次用累加器和列表中的元素作为参数，并计算新累加器 (stepper)，而计算完成之后

⑦ filter 用 foldr 实现

~~myFilter p xs = foldr step [] xs~~

where step $x ys \leftarrow p x = x : ys$

{ otherwise = ys }

所以可用 foldr 定义 xs \rightarrow primitive recursive 前面的元素就直接去掉.

: t - dropWhile isSpace

dropWhile isSpace :: [Char] \rightarrow [Char]

将一个参数传给一个函数时，最前面的元素除了被移掉。

⑧ map 用 foldr 实现

myFoldrMap :: (a \rightarrow b) \rightarrow [a] \rightarrow [b]

myFoldrMap f xs = foldr step [] xs

where step $x ys = fx : ys$

部分函数应用 : currying

niceSumPartial :: [Int] \rightarrow Int

niceSumPartial = foldl (+) 0

niceSumPartial [1..10]

$\Rightarrow 55.$

⑨ foldl 用 foldr 实现

myFoldl :: (a \rightarrow b \rightarrow a) \rightarrow a \rightarrow [b] \rightarrow a

myFoldl f z xs = foldr step id xs

where step $x g a = g(f a x)$

⑩ section 节. 使用括号包围一个操作符，通过在括号里面操作左操作对象或右操作对象。

可产生一个部分应用函数。

⑪ [append] :: [a] \rightarrow [a] \rightarrow [a]

append xs ys = foldl (:) ys xs

map (2^) [3..5]

$\Rightarrow [8, 32]$

map (^2) [3..5]

$\Rightarrow [9, 25]$

⑫ lambda 表达式。

\ 开始，函数体定义 \rightarrow

isInAny needle haystack =

any (xs \rightarrow needle `isInfixOf` s) haystack

⑬ tails "foobar"

$\Rightarrow ["foobar", "obar", "obat", "bat",$

"or", "r", ""]

只能定义一条。

⑭ 部分函数和柯里化

: t - dropWhile

dropWhile :: (a \rightarrow Bool) \rightarrow [a] \rightarrow [a]

(18) suffixes :: [a] → [a]

suffixes xs @ (-; xs') = xs : suffixes xs'

suffixes [] = []

自动派生

data Color = Red | Green | Blue
deriving (Read, Show, Eq, Ord)

⇒ 如果输入值能匹配 @ 符号右边的模式 (-; xs'), 那么就将这个值绑定到
② 符号左边的变量中 (xs)

newtype : declare types, with only
one constructor, with only
one argument.

(9) init : 返回一个列表除了最后一个元素之外的其他元素。

suffixes2 xs = init (tails xs)

⇒ compose :: (b → c) → (a → b) → a → c

compose f g x = f(g x)

(.) = compose

let suffixes f = init . tails.

:type (.) 右关联的

⇒ (.) :: (b → c) → (a → b) → a → c

:type suffixes f

⇒ suffixes f :: [a] → [a].

Chapter 6-

Show : type Show

⇒ show :: Show a ⇒ a → String

data Color = Red | Green | Blue in

instance Show Color where

show Red = "Red"

show Green = "Green"

show Blue = "Blue"

Haskele

① $\text{xor} \Delta$

$\text{xor} :: \text{Bool} \rightarrow \text{Bool} \rightarrow \text{Bool}$	V V	X
	V X	✓
$\text{xor } a \cdot b = (a \text{ } b) \& \&$	X ✓	✓
	not(a & b) X	X

② $\text{head } [] = \text{error} \cdot \text{error}$
 $\text{head } (x : _) = x$
 $\text{tail } [] = \text{error} \cdot \text{error}$
 $\text{tail } (- : xs) = xs$

③ $\text{append } [] \text{ list} = \text{list}$

$\text{append } (e : es) \text{ list} = e : \text{append } es \text{ list}$

④ $\text{reverse } [] = []$

$\text{reverse } (x : xs) = \text{reverse } xs ++ [x]$

⑤ $\text{getNth } [] = \text{error}$

$\text{getNth } n . (x : xs) =$

| $n < 0 = \text{error}$

| $n = \underline{\underline{x}}$

| $n > 0 = \text{getNth } (n-1) \text{ xs}$

⑥ instance Show Card where show = showCard

showCard :: ...

⑦ $\text{factorial} :: \mathbb{Z} \text{Int} \rightarrow \mathbb{Z} \text{Int}$

$\text{factorial } 0 = 1$

$\text{factorial } n = n * (\text{factorial } n-1)$

⑧ $\text{myElement} :: \text{Eq } a \Rightarrow a \rightarrow [a] \rightarrow \text{Bool}$

$\text{myElement } - [] = \text{False}$

$\text{myElement } n . (n : ns) = \text{True}$

$\text{myElement } n . (x : xs) = \text{myElement } n . xs$

⑨ transpose \star

$\text{transpose} :: [[a]] \rightarrow [[a]]$

$\text{transpose } [] = \text{error} \cdot \text{error}$

$\text{transpose } ([] @ (xs : xs))$

| $\text{len} > 0 = \text{transpose}' \text{ len } \text{list}$

| otherwise = error " "

where len = length xs

$\text{transpose}' \text{ len } [] = \text{replicate } \text{len } []$

$\text{transpose}' \text{ len } (xs : xs)$

| $\text{len} = \text{length } xs = \text{zipWith } (:) \text{ xs}$

($\text{transpose}' \text{ len } xs$)

| otherwise = error " "

⑩ $\text{status } [] = (0, 0, 0)$

$\text{status } (n : ns) =$

$\text{let } (len, sum, sumsq) = \text{status } ns.$

~~in~~ $\text{status } (len+1, sum+n, sumsq+n^2)$

⑪ zWith :: $(a \rightarrow b \rightarrow c) \rightarrow [a] \rightarrow [b] \rightarrow [c]$

$\text{zWith } f [] = []$

$\text{zWith } f . - [] = []$

$\text{zWith } f (x : xs) (y : ys) =$

$f x y : \text{zWith } f xs ys$

⑫ $\text{foldl} :: (b \rightarrow a \rightarrow b) \rightarrow b \rightarrow [a] \rightarrow b$

$\text{foldl } - \text{base } [] = \text{base}$

$\text{foldl } f \text{ base } (x : xs) =$

$\text{let newbase} = f \text{ base } x \text{ in }$

$\text{foldl } f \text{ newbase } xs$

(13) foldr : $(a \rightarrow b \rightarrow b) \rightarrow b \rightarrow [a] \rightarrow b$

foldr f base [] = ~~base~~ base

foldr f base (x:xs) =

let fxs = foldr f base xs

in f ~~base~~ x fxs
